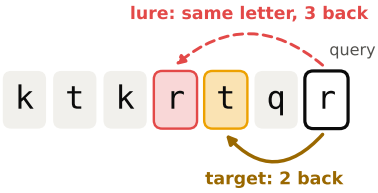
a Task: 2-back with a lure

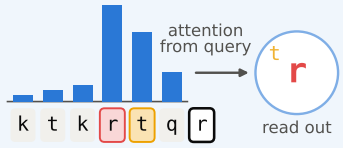


Does the query match the item 2 back?

No: “r” ≠ “t”. Answering “match” because of the 3-back “r” is a lure false alarm.

b Two accounts of the same false alarm

Locating failure (precision account)

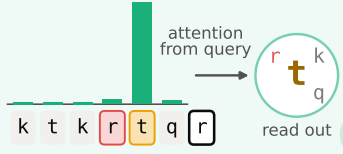


“match” ✗

attention spreads; mostly the lure is read

fix: sharpen attention

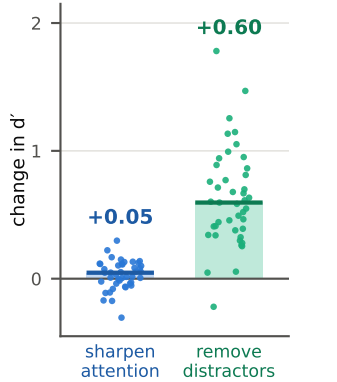
Readout failure (interference account)



“match” ✗

target is read, but other items' content interferes

fix: remove distractors

c Which fix works?


each dot: one model at one N; bar: median
